Clinical Epidemiological Investigation of Moldy grain and fodder poisoning in goat in Kathmandu Valley

Kedar Karki
Senior Veterinary Officer, Central Veterinary Laboratory
Tripureswor, Kathmandu, Nepal

ABSTRACT
An outbreak of a syndrome of unknown etiology associated with the feeding of moldy maize grain and green fodder to goat in a herd of male 3853 goats for sale for the Dashahara festival during the month of October-2010 in Kathmandu valley. In a period of 10 days 500 goats suddenly became ill with symptoms of anorexia, apathy, diarrhea and ruminal stasis. On clinical examination these goats were provisionally diagnosed with sudden illness and moldy corn/fodder poisoning was suspected. They were treated with Biolive, tetralchlor, polyte, C-lyte, Stress care, Antidegnala liquor, but 250 goats died. Necrosis of the fore stomach mucosa was the most characteristic gross pathological change. Clinical pathological findings included mild focal erosions to severe, diffuse, coagulative necrosis of the mucosa in the rumen, reticulum and omasum and congestion and hemorrhages in the abomasum. Liver with shrunken appearance and pale to yellowish discoloration with bile filled distended bladder pin point hemorrhage in kidney, intestine with excessive mucus. On mycological and microbiological examination of tissue samples from post-mortem of dead goat on respective medium revealed the growth of fungal pathogens like Penicillium spp with Staphylococcus. These results provide circumstantial evidence that feeding on moldy maize grain and green fodder leaves infested with Penicillium may cause outbreaks of systemic Mycosis in goats.

KEY WORDS: Moldy maize, green fodder, Penicillium Spp, Fungus, Male Goat, Kathmandu valley, Dashahara.

INTRODUCTION
During the Dashahara festival of the year 2010 about 3853 male goats intended to be supplied by Nepal Food Corporation to the customers in Kathmandu valley were being purchased from Eastern region, Central region, Mid-western region of Nepal. In lairage these goats were being fed occasionally with whole maize grains and exclusively green fodder leaves. On clinical examination based on history these goats were provisionally diagnosed with sudden illness suspected to be due to moldy corn/fodder poisoning. They were treated with Toxalivom Biolive, tetralchlor, polyte, C-lyteand Stresscare, Antidegnala liquor (Zinc salt solution) in drinking water.

MATERIALS AND METHODS
Clinical examination of goats in lairage
From 2067-6-20 about 500 goats present in lairage for sale in Nepal Food Corporation's compound, were clinically examination, were for symptoms similar to those reported by various workers White [1], Schneider et al. [2] and Whitlow et al. [3] about poisoning from pathogens in grain and fodder.

Post-Mortem Examination of dead goats.
Post-Mortem examination of all the dead goats was done in the premises of the food corporation compound for pathological effects similar to those experimentally induced by Schneider [2] and reported by Dhma et al.[4] and Hussein et al. [5].

Microbial/Mycobial Culture examination of Post-Mortem Tissue samples
Mycological and microbiological examination was done on tissue samples from the dead goats cultures made on respective media for the growth of fungal pathogens like Penicillium spp with Staphylococci similar to the findings of Karki [6]; Wendell [7], Roberts et al, [8]; Sabreen et al [9]. All nasal and rectal swabs from sick and dead animals were tested for PPR with pendside test.
Treatment and preventive measures applied
All the goats present in lairage were treated with Toxalivom Biolive, tetrachlor, polyte, C-lyte, Stresscare, Antidegnala liquor(Zinc salt solution) as described by Pinto et al. [10] in Controlling Pithomyctotoxicosis (facial eczema) in ruminants, in the Azores, Portugal in drinking water.

RESULTS AND DISCUSSION
As during warm humid climate of tropics and subtropics favours growth of mold and fungus in feed grains and fodder especially after heavy monsoon rain feeding livestock and poultry exclusively on such grain seems to cause the detrimental effect in the health to these animals. In this investigation there were clinical signs of anorexia, apathy, diarrhea and ruminal stasis and linical pathological findings included mild focal erosions to severe, diffuse, coagulative necrosis of the mucosa in the rumen, reticulum and omasum and congestion and hemorrhages in the abomasum. The liver had shrunken appearance and pale to yellowish discoloration with a bilefilled distended bladder pin point hemorrhage in kidney, and small intestine with excessive mucus. On mycological and microbiological examination of tissue samples from post-mortem of dead goat on respective medium revealed the growth of fungal pathogens like Aspergillus and Penicillium spp with Staphylococcus spp. All nasal and rectal swabs from sick and dead animals that were subjected to the PPR with penside test turned out to be negative. These results provide circumstantial evidence that feeding of moldy maize grain and green fodder leaves infested by Penicillium and Aspergillus spp may have caused this outbreak of a systemic Mycosis in these goats and therefore there need for thorough investigation in field areas from where these goats were bought.

ACKNOWLEDGMENT
I would like to thank Mr. Bal Bahadur Kunwar Mr. Tek Bahadur Air Senior Vet. Technician, Mr. Bhimsen Adhikari Vet. Technician of Microbioly Unit, Mr. Purna Maharajan Vet Technician of Central Veterinary Laboratory for doing the microbiology and post-mortal work and office assistant Mr. Chandra Bahadur Rana for his tireless effort in handling the carcasses during post-mortal work.
